DELTA INSTRUMENT LLC

PRESS RELEASE

Delta Instrument announces targeted solution to meet new EPA refinery flare regulations

Combustion Calorimeter continuously monitors Direct Net Heating Value in flare vent gases.

NORTHVALE, NJ September 14, 2016: Delta Instrument LLC, a leading supplier of a complete range of combustion, moisture, and emission monitors, has announced today their flare monitoring solution that meets the requirements of the revised EPA MACT CC guidelines. This Class 1 Division 2 area rated solution allows flare operators to continuously monitor direct net heating value in the off-gases gases that are being vented to a flare.

"The EPA released a new mandate for flare performance operating limits, which applies to all flares subject to the MACT CC requirements. With both the indoor and outdoor models of the CWD 2005, we can measure well within the $\pm 2\%$ accuracy requirement for NHV_{CZ} operating values," noted Steve Diorio, President of Delta Instrument.

The Union product line has established its reputation for quality for over 90 years helping customers achieve direct and continuous measurement of combustible gas quality in the world's major process industries.
